EQUITY CURVE202 sessions · starting at \$10000.00

ANALYST NOTE

Hera local LLM

The +41.20% ROI and perfect win rate on SM look strong, but a sample size of only two trades provides zero statistical confidence. A 32.83% max drawdown is excessive for such a small sample, indicating high volatility or poor risk management during the losing or breakeven periods. The Sharpe ratio of 1.21 is unreliable without a larger dataset to validate consistency over time. We cannot distinguish skill from luck with just two data points. Next step is to run a 12-month backtest with at least fifty trades to establish meaningful statistical significance before considering live deployment.
