ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v956 backtest on AAPL shows a +10.70% return, yet the statistical significance is negligible with only two trades executed. A 50% win rate and 0.87 Sharpe ratio are unconvincing without larger sample sizes, while the 11.50% drawdown indicates high exposure to single-event risk. The strategy lacks robustness because a pair of trades cannot validate edge or filter false positives reliably. We must expand the backtest window and optimize parameters to generate a statistically valid equity curve before deployment.
