ANALYST NOTE

Hera local LLM

The LPG backtest shows a strong 42.1% ROI driven by a high 66.7% win rate, yet the strategy is statistically insignificant with only three total trades. The 21.82% maximum drawdown indicates substantial volatility risk that the small sample size fails to capture reliably. A Sharpe ratio of 1.14 suggests acceptable risk-adjusted returns, but confidence in this performance is currently too low to generalize. To validate the edge, we must expand the sample size through a longer historical simulation or by backtesting against additional LPG market regimes. This approach will clarify whether the results stem from genuine alpha or mere luck in a small dataset.
