ANALYST NOTE

Hera local LLM

The EVO_EVOWEBIDEA_v172 strategy generated an 18.35% return on ASC, yet the sample size of only three trades renders the 66.7% win rate statistically insignificant for institutional deployment. While the risk-adjusted return of a 0.82 Sharpe ratio indicates marginal efficiency, the 17.18% maximum drawdown suggests uncontrolled volatility exposure during drawdown periods. The limited data prevents confident extrapolation of performance, as a few adverse trades could drastically alter the equity curve. We must expand the test window or adjust entry filters to ensure robustness before considering live allocation. Next, run a 200-candle backtest with stricter stop-loss logic to validate the 17.18% drawdown threshold.
