ANALYST NOTE

Hera local LLM

The EVO_EVOEVOE_v546 strategy on GOOGL generated a nominal +6.75% return, yet the 33.3% win rate and 0.54 Sharpe ratio indicate a statistically insignificant edge derived from only three trades. The 15.79% maximum drawdown suggests high volatility exposure that the small sample size failed to filter adequately. With such a low trade count, the results lack robustness and cannot reliably predict future performance under different market regimes. We must increase the historical lookback period or adjust entry filters to generate a sufficient trade volume before deployment.
