ANALYST NOTE

Hera local LLM

The EVO_EVOWEBIDEA_v379 strategy on SM achieved a 100% win rate and +43.36% ROI, but only across two trades, rendering the Sharpe of 1.26 and zero drawdown statistically meaningless. A perfect win rate with such a tiny sample size is a classic overfitting artifact that fails to generalize to live market conditions. The massive 32.83% drawdown reported in the metadata contradicts the trade count, suggesting a data integrity error or a theoretical worst-case scenario rather than realized loss. We must reject this result until we expand the backtest window to hundreds of trades for robust validation. Next, re-run the strategy on a longer historical dataset to filter out noise and verify if the edge persists beyond this lucky sample.
