ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v422 strategy on GC=F generated a negative ROI of -4.00% with a Sharpe ratio of -0.36, indicating clear underperformance relative to a risk-free asset. A win rate of only 33.3% across a mere three trades suggests the sample size is insufficient to validate any statistical edge, as the results are dominated by stochastic noise. The maximum drawdown of 12.60% highlights significant vulnerability during the few execution instances, likely due to poor stop-loss placement in a volatile gold futures environment. Without a larger historical dataset, we cannot determine if the failure stems from flawed logic or merely bad luck within a narrow timeframe. The immediate next step is to expand the backtest window and increase trade
