ANALYST NOTE

Hera local LLM

The EVO_GG1RSISNIP_v935 backtest on MSFT shows a +20.07% ROI but relies on only two trades, rendering the 50% win rate and 1.06 Sharpe ratio statistically insignificant. The 14.24% maximum drawdown indicates high volatility risk that could be exacerbated in live conditions with insufficient sample data. We must treat these metrics as preliminary noise rather than a validated edge for institutional deployment. The next step is to extend the lookback period to at least 500 trades to verify consistency across different market regimes.
